

8. Project Demonstration Phase

ComicCraft – AI Comic Story Creator

Introduction

The demonstration phase presents the completed ComicCraft application and shows the complete workflow from user input to final comic PDF.

Demonstration Setup

Start the project using the documented virtual environment and run.py instructions. The application is opened at the local address <http://127.0.0.1:8000>. The demonstration should use a valid Gemini API key when real story generation is required.

Step 1 – Enter Inputs

Demonstrate the creation form by entering a story prompt and, where required, a character name/description, setting, tone, art style, panel count, and additional instructions.

Step 2 – Generate Story

Use the Generate function to request a structured story from Gemini. Demonstrate the resulting title, summary, character profile, panels, narration, dialogue, scene descriptions, and image prompts.

Step 3 – Generate Comic

Generate the panel illustrations and display the finished comic in the responsive interface. Demonstrate that each panel has associated visual content and story information.

Step 4 – Regenerate a Panel

Select an individual panel and demonstrate the Regenerate Panel feature. This shows that a selected panel can be regenerated without unnecessarily recreating the entire comic.

Step 5 – Download PDF

Use the Download PDF function and demonstrate the generated document containing the title, summary, panel images, narration, dialogue, and page numbers.

Step 6 – Explain Technical Workflow

During the final demonstration, explain the connection between the frontend, FastAPI endpoints, Gemini story generation, Diffusers/Stable Diffusion image generation, Pillow image processing, and ReportLab PDF creation.

Conclusion

The demonstration concludes by showing the complete integrated workflow and verifying that the project components work together as specified.
